

DEVELOPERS AND ARCHITECTS

STRATEGIES 2018

Oliver Sturm • @olivers • oliver@oliversturm.com

OLIVER STURM

- Training Director at DevExpress
- Consultant, trainer, author, software architect and developer for over 25 years
- Microsoft C# MVP
- Contact: oliver@oliversturm.com

AGENDA

Idea: Talk about technology

- Application building blocks
- Services
- Microservices
- Data persistence
- Security
- IoT
- User Interfaces
- Programming Languages
- Mobile
- Cloud

APPLICATION BUILDING BLOCKS

- What is an "application" made of?
- Terminology check:
 - Client application
 - Server application
 - Web application
 - Application system
 - Enterprise application

TERMINOLOGY: CLIENT APPLICATION

- Kann auf einem "Client" laufen
 - Client im Gegensatz zum Server
- Kann im Client/Server-Zusammenhang verstanden sein
- Thin/Fat-Clients
 - Einfaches Konzept aus architektureller Sicht
 - Sehr einfaches Deployment einer einzelnen Installation
 - Statische, planbare Anforderungen an Kommunikationsinfrastruktur

TERMINOLOGY: SERVER APPLICATION

- Laeuft wahrscheinlich auf einem Server
 - Kann auch ein Client sein...
- Stellt Dienste bereit
 - ...oder automatisierte Funktionen

TERMINOLOGY: WEB APPLICATION

- Traditionell: Server-Anwendung, die ueber HTTP Daten verfuegbar macht
- Modern: Basiert auf HTML/JS
 - Serverkomponente noch immer wichtig
 - Gegenbeispiel: Wenn ein Spiel durch den AppStore auf mein iPhone gelangt und nie mit einem Server redet, ist es keine Web-Anwendung, auch wenn es in HTML/JS geschrieben ist

TERMINOLOGY: APPLICATION SYSTEM

- Die meisten "Anwendungen" haben heutzutage mehrere Komponenten und sind eigentlich Anwendungssysteme

TERMINOLOGY: ENTERPRISE APPLICATION

- Enterprise-Anwendungen skalieren fuer sehr grosse Organisationen und Datenvolumen
- Architekturell nicht unbedingt anders als andere Anwendungen

SERVICES

- Part of most architectural concepts
- SOA?
- Web Services
- "Real-time web?" SignalR? socket.io?

SERVICES — SOA

Remember the four tenets Don Box got excited about?

- Boundaries are explicit
- Services are autonomous
- Services share schema and contract, not class
- Service compatibility is determined based on policy

SOA *resulted* in a very formal understanding of service architecture, which is fortunately not shared by too many architects today.

WEB SERVICES

- ASMX — WSE — WCF — WSDL — SOAP — Microsoft's world of enormous complexity intended to solve a very simple problem
- RESTful services: the most complicated part is the name
 - URLs and HTTP methods
 - JSON, XML and possibly other data formats, using content negotiation

SERVICES — REAL-TIME WEB

- WebSockets and their various ancestors
- Bi-directional communication

Reasoning against real-time web techniques:

- In manchen Faellen braucht man "nur" AJAX
 - Client definiert den Zeitpunkt
 - Kann automatisch von Caching profitieren
- Bedenken Sie die "Kosten"
- Codestruktur aehnlich State Machine

MICROSERVICES

How big is a microservice? It depends.

- Do one "thing" well. What's a "thing"? It depends.
- Two-pizza team
- Throwawayable
- Focus on boundaries and business context, not on lines of code

MICROSERVICES — COMMUNICATION

- Direct communication between services
- Message Queues
- Service Bus (ESB)

MICROSERVICES — COMPOSITION

- Manual composition? Painful.
- Docker containers
- docker-compose
- Cloud container services (ecs-cli, Azure Docker VM extension)
 - Also support composition

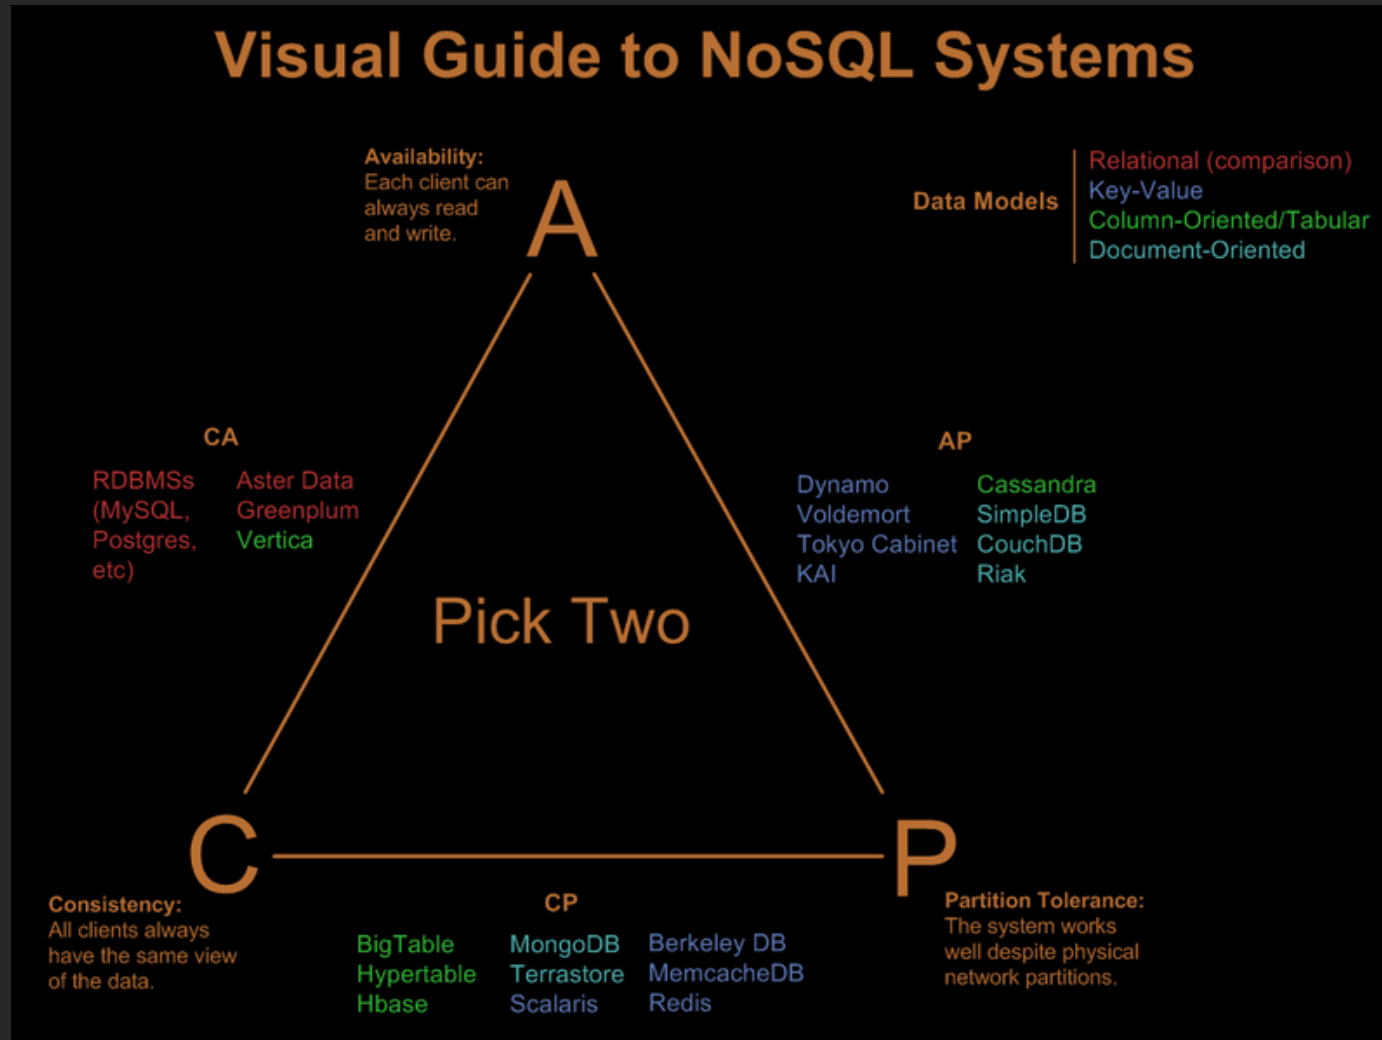

MICROSERVICES — SERVERLESS

- Function level composition: AWS Lambda, Azure Functions, Google Cloud Functions, ...
 - Integration with cloud infrastructure for triggering and output generation
- Event driven, scalable systems with minimal infrastructure management requirements
- Pay as you go
- Lock-in effect
- Debugging, Testing...

DATA PERSISTENCE

- Relational databases
- NoSQL options
 - Key/value and column family stores
 - Document
 - Data analytics (e.g. MapReduce)

DATA PERSISTENCE — NoSQL

DATA PERSISTENCE — NoSQL

Visual Guide to NoSQL Systems

THANKS

... to Nathan Hurst <nathan@developersforgood.org> for the only image in this presentation, used with permission.

Availability
All clients always have the same view of the data.

BigTable
Hypertable
Hbase

MongoDB
Terrastore
Scalaris

Berkeley DB
MemcacheDB
Redis

Partition Tolerance
The system works well despite physical network partitions.

REASONING NoSQL vs RDBMS:

- Sicherstellen, dass von den Ideen der relationalen Datenhaltung profitiert wird
- NoSQL sehr vielfaeltig

DATA PERSISTENCE — ORM

- Choice of frameworks
- Top Down or Bottom Up?
- DB Independence

DATA PERSISTENCE — CQRS

Command/Query Responsibility Segregation

- Separate query and command models
- Conflicts with ORM?
- Event Sourcing
 - Eventual consistency

USER INTERFACES

- Platforms
 - Native: WinForms, XAML
 - HTML
 - Electron

Reasoning for native UI platforms:

UI APPLICATION PATTERNS

- MVVM
- Flux

HTML UI — WHERE TO RENDER

- Traditional web-server based rendering?

Reasoning:

PROGRAMMING LANGUAGES

- .NET: C#, VB.NET, F#, others?
- JavaScript: Native, TypeScript, CoffeeScript, LiveScript, others?

MOBILE

- Mobile support as a conceptual module
- Strategic platform?

"NATIVE" MOBILE

- iOS SDK
- Android SDK
- Windows Phone?

Reasoning:

MOBILE.NET

- Xamarin
 - Native
 - Forms

Reasoning:

MOBILE — HTML/HYBRID

- HTML (5), JavaScript, CSS
- PhoneGap/Cordova, CrossWalk, nw.js, ...
- Cross-platform

Reasoning:

CLOUD

- Deployment option
 - Related: Docker?
- Managed infrastructure

CLOUD FUNCTIONALITY

- Supplied services, vertical features
- Base platform functionality
 - Dynamic scalability
 - SLA
- Serverless computing

CLOUD — LEGAL CONSIDERATIONS

- Locations
- Industry/governmental requirements

CLOUD OPTIONS

- Azure, Amazon Web Services (PaaS, IaaS)
- PaaS: Google (also some IaaS now), Heroku, others
- SaaS: Office 365, Azure/AWS Websites, ...

CLOUD REASONING

- For/against cloud:
- For/against specific platforms, IaaS, PaaS:

OPEN SOURCE

- Everybody does it, right?
- Give and take...

Reasoning:
